# To Max or not to Max: Online Learning for Speeding Up Optimal Planning

#### C. Domshlak E. Karpas S. Markovitch

Faculty of Industrial Engineering and Management

Faculty of Computer Science Technion

July 4, 2010

## Outline

- 2 Theoretical Model
- From Model to Practice
  - Dealing with Model Assumptions
  - Learning
  - Using the Classifier

Motivation

- We want to do domain independent optimal planning, in a time-bounded setting
- Use A\*

Motivation	Theoretical Model	From Model to Practice	Experimental Evaluation

# Why Settle for One?

#### There is no single best heuristic, so why settle only for one?

• We can use the maximum of several heuristics to get a more informative heuristic

Ñ

・ロト ・ 四ト ・ ヨト ・ ヨト ・ ヨー

# Why Settle for One?

- There is no single best heuristic, so why settle only for one?
- We can use the maximum of several heuristics to get a more informative heuristic

# Why Settle for One?

- There is no single best heuristic, so why settle only for one?
- We can use the maximum of several heuristics to get a more informative heuristic
- Sample results:

Domain	h <sub>LA</sub>	h <sub>LM-CUT</sub>	max <sub>h</sub>
airport	25	38	36
freecell	28	15	22

Number of problems solved in 30 minutes

# Why Settle for One?

- There is no single best heuristic, so why settle only for one?
- We can use the maximum of several heuristics to get a more informative heuristic
- Sample results:

Domain	h <sub>LA</sub>	h <sub>LM-CUT</sub>	max <sub>h</sub>
airport	25	38	36
freecell	28	15	22

Number of problems solved in 30 minutes

 A more informed heuristic solves less problems — something is rotten in the kingdom of A\*

### The Accuracy / Computation Time Tradeoff

#### Conclusion

A more informed heuristic is not necessarily better

イロン 不得 とくほ とくほ とうほう

# A Simple Observation

#### • So how can we benefit from multiple heuristics?

• Simple observation: the maximum of several heuristics — is simply the value of one of those heuristics

#### • This leads to the following idea:

- Given state *s*, and heuristics  $\{h_1, \ldots, h_n\}$
- Choose h<sub>i</sub> = ORACLE(s, {h<sub>1</sub>,..., h<sub>n</sub>})
- Compute only h<sub>i</sub>(s)

イロン 不得 とくほ とくほ とうほう

# A Simple Observation

- So how can we benefit from multiple heuristics?
- Simple observation: the maximum of several heuristics is simply the value of one of those heuristics
- This leads to the following idea:
  - Given state *s*, and heuristics  $\{h_1, \ldots, h_n\}$
  - Choose  $h_i = \text{ORACLE}(s, \{h_1, \ldots, h_n\})$
  - Compute only h<sub>i</sub>(s)

# A Simple Observation

- So how can we benefit from multiple heuristics?
- Simple observation: the maximum of several heuristics is simply the value of one of those heuristics
- This leads to the following idea:
  - Given state *s*, and heuristics  $\{h_1, \ldots, h_n\}$
  - Choose  $h_i = \text{ORACLE}(s, \{h_1, \dots, h_n\})$
  - Compute only h<sub>i</sub>(s)

#### The Oracle

#### How do we define ORACLE?

• Naive answer: use the heuristic which gives the maximum value

$$ORACLE(s, \{h_1, \ldots, h_n\}) = \operatorname{argmax}_i h_i(s)$$

- Why is this naive?
- Because sometimes the extra time to compute the most informed heuristic is not worth it
- Example: *h*<sub>LM-CUT</sub> is about 9.4 times slower than *h*<sub>LA</sub>

- How do we define ORACLE?
  - Naive answer: use the heuristic which gives the maximum value

$$ORACLE(s, \{h_1, \ldots, h_n\}) = \operatorname{argmax}_i h_i(s)$$

- Why is this naive?
- Because sometimes the extra time to compute the most informed heuristic is not worth it
- Example: h<sub>LM-CUT</sub> is about 9.4 times slower than h<sub>LA</sub>

- How do we define ORACLE?
  - Naive answer: use the heuristic which gives the maximum value

$$ORACLE(s, \{h_1, \ldots, h_n\}) = \operatorname{argmax}_i h_i(s)$$

- Why is this naive?
- Because sometimes the extra time to compute the most informed heuristic is not worth it
- Example: h<sub>LM-CUT</sub> is about 9.4 times slower than h<sub>LA</sub>

Ñ

- How do we define ORACLE?
  - Naive answer: use the heuristic which gives the maximum value

$$ORACLE(s, \{h_1, \ldots, h_n\}) = \operatorname*{argmax}_i h_i(s)$$

- Why is this naive?
- Because sometimes the extra time to compute the most informed heuristic is not worth it
- Example: h<sub>LM-CUT</sub> is about 9.4 times slower than h<sub>LA</sub>

Ñ

- How do we define ORACLE?
  - Naive answer: use the heuristic which gives the maximum value

$$ORACLE(s, \{h_1, \ldots, h_n\}) = \operatorname*{argmax}_i h_i(s)$$

- Why is this naive?
- Because sometimes the extra time to compute the most informed heuristic is not worth it
- Example: h<sub>LM-CUT</sub> is about 9.4 times slower than h<sub>LA</sub>

## **Our Contributions**

- We develop a theoretical model for determining which heuristic is best to compute at each state, in order to minimize search time
- We derive a decision rule from the model, which is used as a target concept for a classifier
- We describe an online learning scheme which uses this classifier during search

# Theoretical Model - Which Heuristic to Compute When?

#### Assumptions

- State space is a tree
- Single goal state
- Uniform cost actions
- Constant branching factor b
- Perfect knowledge
- Two heuristics:  $h_1$  and  $h_2$ 
  - Consistent
  - Evaluating *h<sub>i</sub>* takes time *t<sub>i</sub>*

Experimental Evaluation

### Learning

- Pre-search:
  - Collecting training examples
  - Labeling training examples
  - Generating features
  - Building a classifier
- During search:
  - Classification
  - Active learning

# **Collecting Training Examples**

- State space is sampled using stochastic hill climbing "probes"
  - Depth limit =  $2 * h(s_0)$
  - Probability of expanding successor  $s \sim 1/h(s)$
- All generated states are added to the training set
- Probing stops when enough training examples are collected

# Labeling Training Examples

- *b*, *t*<sub>1</sub>, *t*<sub>2</sub> are estimated from the collected examples
- $h_2 h_1$  is calculated for each state
- Each example is labeled by  $h_2$  iff  $h_2 h_1 > \alpha \log_b(t_2/t_1)$
- WLOG t<sub>2</sub> > t<sub>1</sub> the choice is always whether to evaluate the more expensive heuristic

◆□ ▶ ◆圖 ▶ ◆ 圖 ▶ ◆ 圖 ▶ ○ 圖 ○

## **Generating Features**

- We perform online learning, for a specific problem, so we do not need to generalize across problems
- This allows us to use features which fully describe each state
- We use the simplest features just values of state variables
- Better features will probably lead to better results

▲□▶▲□▶▲□▶▲□▶ ▲□▶ ● □ ● ● ●

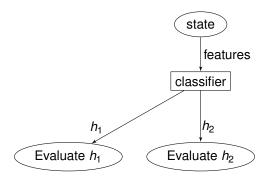

# **Building a Classifier**

- We use the Naive Bayes classifier
  - Very fast
  - Incremental can be updated quickly on the fly
  - Provides probability distribution for classification

Experimental Evaluation

## Using the classifier

#### State Evaluation

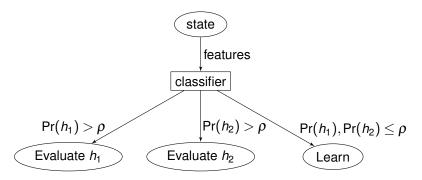

Experimental Evaluation

## Using the classifier

#### State Evaluation

ã

#### **Final Remarks**

- This is an active online learning scheme
- Using multi-valued variable representation (and not STRIPS) helps, because it reduces dependence between state variables
- This approach can be easily extended to multiple heuristics
  - Learn a classifier for each pair
  - Decide which heuristic to use by voting

#### Outline

  - Using the Classifier

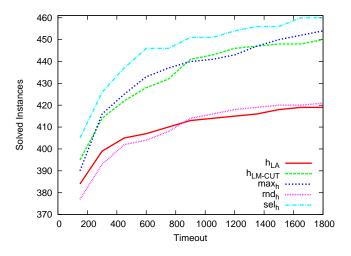

▲□▶▲□▶▲□▶▲□▶ □ のQで

#### **Evaluation**

- We evaluted on problems from 22 domains from IPC 1 5
- We used two state of the art heuristics
  - h<sub>LM-CUT</sub> Helmert and Domshlak 2009
  - h<sub>LA</sub> Karpas and Domshlak 2009
- Parameters
  - $\alpha = 1$  decision rule bias
  - ho= 0.6 confidence threshold
  - Training set size = 100

Experimental Evaluation

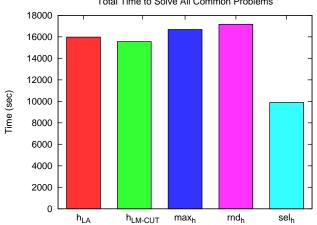

#### **Anytime Behavior**

3

#### Conclusions

- It is possible to efficiently combine several admissible heuristics
- This leads to state-of-the-art performance

• Online learning can help in optimal planning

• I should probably read Hamlet
