What is Planning?

▲ロト ▲ □ ト ▲ □ ト ▲ □ ト ● ● の Q ()

What is Planning?

- Given initial state, goal, and description of possible actions, find a sequence of actions which leads from the initial state to the goal
- How are these described?
 - Symbolically, e.g., in PDDL
 - With a black-box successor generator

▲ロト ▲ □ ト ▲ □ ト ▲ □ ト ● ● の Q ()

What is Planning?

- How are these described?
 - Symbolically, e.g., in PDDL
 - With a black-box successor generator

▲□▶▲□▶▲□▶▲□▶ □ のQで

The Symbolic Approach

- Problem description is given by:
 - A set of state variables F
 - A set of actions A
 - Preconditions and effects are partial assignments to F
 - Initial state is a complete assignment to F
 - Goal is a partial assignment to F
- PDDL also adds types, objects, parameters

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

The Black-Box Approach

- Problem description is given by:
 - Initial state s₀ some opaque object
 - Successor generator succ a function which can be applied to a state s and returns a list of applicable actions and their successor
 - Goal test *goal*? a function which can be applied to a state and returns whether that state is a goal state

Black-Box vs. Symbolic Approach

- Symbolic approach allows us to automatically derive heuristics
- Symbolic approach is sometimes harder to understand
 - I realize this is the wrong room to make this point, but consider students you've taught PDDL
- Black box approach allows for more efficient successor generation
 - No need for "unnecessary" parameters in actions, e.g., in DRIVE(?FROM, ?TO) — we know where we are (see also Areces, Bustos, Dominguez and Hoffmann, 2014)
 - No need for static predicates which encode math, e.g., NEXT(N1,N2), NEXT(N2,N3), ...

Black-Box vs. Symbolic Approach

 - No need for static predicates which encode math, e.g., NEXT(N1,N2), NEXT(N2,N3), ...

▲□▶▲□▶▲□▶▲□▶ □ のQで

The Best of Both Worlds?

- We introduce the Semi Black-Box approach
- Combines the flexibility of the black-box approach with the ability to automatically derive a heuristic
- Implemented in a Java framework called object oriented planning

Object Oriented Planning

- A state consists of a set of entities
 - These are objects in the *pddl* sense, which are implemented as objects in Java
 - Each entity has an internal state (e.g,. location)
- Operators (ungrounded actions) are implemented as Java classes
 - Operator implements two functions: ISAPPLICABLE and APPLY
 - Successor generator calls ISAPPLICABLE for all possible parameter combinations (according to entities in given state)
 - If an operator + parameters is applicable, APPLY is called to generate the successor
- So far, this is purely a black-box framework

▲□▶▲□▶▲□▶▲□▶ □ のQで

Object Oriented Planning: Archetypes

- The framework also contains a set of entities and operators with known behavior
 - Intuitively, a set of entities and operators that corresponds to a known PDDL domain
- We refer to these known entities and operators as archetypes
 - Example: MobileEntity and Move operator
- Users can *inherit* from these, and modify their behavior
- Note: unlike PDDL, actions can create or destroy entities

▲□▶▲□▶▲□▶▲□▶ □ のQで

Object Oriented Planning: Archetypes

- The framework also contains a set of entities and operators with known behavior
 - Intuitively, a set of entities and operators that corresponds to a known PDDL domain
- We refer to these known entities and operators as archetypes
 - Example: MobileEntity and Move operator
- Users can inherit from these, and modify their behavior

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Example: Vehicle Entity

```
public class Vehicle extends MobileEntity {
  private int vehicleCurrentCapacity;
  private final int maximalCapacity;
  public Vehicle (String entityId, long time,
      long timeBound, Place location,
      RoutingRequest constraints,
      int maxCapacity) {
    super(entityId, time, timeBound,
                    location, constraints);
    maximalCapacity = maxCapacity;
    vehicleCurrentCapacity = -1;
```

Example: Drive Action

```
public class Drive extends Move {
  public Drive(
    ILocationService locationService){
    super("DRIVE_ACTION", Vehicle.class,
        Place.class, locationService,
        1, 0, 0);
}
```

Heuristics for Object Oriented Planning Problems

High level idea

- Project the problem onto the known aspects
- Use a known heuristic on this symbolic planning problem
- Can not make any guarantees on admissibility or dead-end safety because we can not know what behavior the user overrode
- However, because entities can be created and destroyed, we can not ground the problem during preprocessing
- We implemented a lifted variant of $h_{FF}(\Pi^{C})$
 - Actions are grounded on-the-fly, as they are added to the relaxed planning graph
 - Since we know the domain, we can also choose a good C

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Empirical Evaluation

- We tested on two domains:
- Commuter car pooling
 - A set of commuters can drive vehicles and pick each other up
 - Each commuter has temporal constraints on when they can leave their house, get to work, leave work, and get back home
 - Supported by another feature of our framework temporally expressive goals
 - Compared to LAMA and GBFS with FF heuristic (running on PDDL encoding), to our framework without the heuristic, and to optic on PDDL 2.1 encoding
- Evolution
 - A set of entities can move between different locations and mate (if they are in the same place)
 - Goal is to create an entity whose ancestors include a given set of entities
 - Impossible to model in PDDL, so only SBB was tested

Summary

- Presented the object oriented planning framework, which adds some symbolic elements to black-box planning
- Empirically showed the benefits of this approach
- Future work
 - Add more archetypes to the framework, possibly with a generic mechanism for adding PDDL notations
 - Empirical evaluation of people's ease-of-use of BB, SBB, and PDDL
